

Investor presentation

May 2017

Saras Group's Annual Financial Results and information are audited.

In order to give a better representation of the Group's operating performance, and in line with the standard practice in the oil industry, the operating results (EBITDA and EBIT) and the Net Result are provided also with an evaluation of oil inventories based on the LIFO methodology (and not only according to FIFO methodology adopted by IFRS), because LIFO methodology does not include end-of-period revaluations and write-downs. Furthermore, the non-recurring items for nature, relevance and frequency, as well as the "*fair value*" of the open positions of the derivative instruments used for oil and Forex are also excluded, both from the operating results and from the Net Result. Operating results and Net Result calculated as above are called respectively "*comparable*" and "*adjusted*" and they are not subject to audit or limited review.

DISCLAIMER

Certain statements contained in this presentation are based on the belief of the Company, as well as factual assumptions made by any information available to the Company. In particular, forward-looking statements concerning the Company's future results of operations, financial condition, business strategies, plans and objectives, are forecasts and quantitative targets that involve known and unknown risks, uncertainties and other important factors that could cause the actual results and condition of the Company to differ materially from that expressed by such statements. This presentation has been prepared solely by the company.

Saras investment thesis: **our value proposition**

Refining

Power Generation

Other activities

Supply & Trading

- ~150 crude cargoes every year from wide range of suppliers
- Supply & Trading company operating in Geneva since Jan 2016
- Balanced and differentiated sales portfolio...
- ... with world class oil supply chain knowledge

Exploit market opportunities for both crude oils & products

Sarroch Industrial Operations (strictly integrated refinery and power plant)

- Largest single-site refinery in the Mediterranean basin (300 kbl/d, ~16% of Italy's refining capacity)
- Top-tier large & complex Med refinery, according to Nelson and Wood MacKenzie Indexes
- Yields of medium and light distillates exceed 80% of the production output (net of C&L)¹
- Fuel Oil yield approx. 6%
- Petrochemical integration

Top-tier performance, thanks to high complexity and flexible configuration

- Largest liquid fuel gasification plant in the world (IGCC)
- Conversion of heavy refining fractions (TAR) to clean gas
- 575 MW of installed capacity
- Electricity production of approx. 4.2 - 4.4 TWh
- CIP6 tariff until 2021

Transform heavy refining fractions (TAR) into electricity, sold at incentivized tariff

Marketing

- Marketing activities in Italy and Spain:
 - ~8% MS² in Italian wholesale market
 - ~ 10% MS in Spanish wholesale market , and presence also in retail (with ~100 stations)

Stabilize refining margins with downstream presence

Wind Energy

- Wind farm with capacity of 96 MW in Ulassai (Sardinia)
- Utilization factor higher than Italian average

Further stabilize Group results, with incentivized scheme for renewable energy

1. C&L = Consumption & Losses
2. Market Share

1. As of May, 18th 2017

Favourable refining economics expected to continue

Starting in 2015, structural changes strengthened the EU refining, and favourable economics are expected to continue in 2017 and beyond

- More balanced oil prices, robust supply
- Improving product demand
- Rationalization of EU refining capacity
- Correction of market distortions
- Robust product differentials
- Strong US Dollar

Benefits for typical EU refiners

- Healthy refining margins
- EU refineries essential to regional supply chain
- Low impact of fixed costs in EUR

Saras' differentiating factors

- Flexibility to source the most profitable crudes
- Asset capability to process multiple types of crudes
- Conversion to high-value product mix
- Steeper decrease of "consumption & loss" costs
- Track record in delivery of improvement initiatives

The new market cycle derives from 6 key structural changes

| | | |
|-----|--|--|
| i | High crude prices | More balanced oil prices, robust supply |
| ii | Low availability of heavy sour crudes | Large availability of heavy crudes |
| iii | Falling product demand in Europe | Improving product demand in Europe and worldwide |
| iv | Refining overcapacity | Ongoing rationalization of European refining capacity Over estimation of global spare capacity |
| v | Strong competition from: <ul style="list-style-type: none"> • Wide Brent-WTI spread • Non-OECD refineries | Correction of market distortions Reduction of global spare capacity Increase of international freight rates |
| vi | Low crack spreads and tight light-heavy products differentials | Healthy crack spreads and wider light-heavy product differentials (greater benefits for complex refineries) |

OPEC compliance to the agreed production cuts high so far...

Source: OPEC Secretariat.

- OPEC compliance looks quite high...
- ...but from a very high baseline in Q4/16
- When looking at the difference versus FY/16 average production, the volumes reduction is only 500 tb/d
- Moreover Libya (which is exempt from cuts) is increasing its production

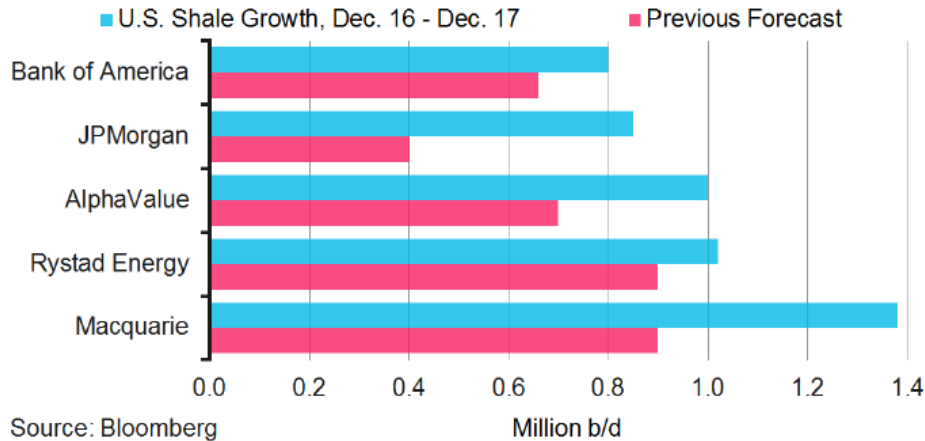

...but USA, along with other producers, keep the market well supplied

1. "Comparable" and "Adjusted" results evaluate oil inventories based on LIFO methodology (while IFRS accounting principles adopt FIFO methodology), because LIFO methodology does not include end-of-period revaluations and write-downs, and it provides a more representative view of the Group's operating performance. Moreover, "Comparable" and "Adjusted" results do not include non-recurring items and "fair value" of the open positions of the derivative instruments on oil and Forex.

2. Net financial Position / Equity

Comparable EBITDA¹ (EUR MM)

1. "Comparable" results evaluate oil inventories based on LIFO methodology, and do not include non-recurring items and "fair value" of the open positions of the derivative instruments on oil and Forex.

Med refineries by complexity index¹ and capacity

Index that measures the degree to which refineries are equipped with conversion capacity to transform heavier residue streams into lighter fractions

Output yields³

Heaviest stream of output sent to Power Generation unit (IGCC) for electricity production

Top-tier refineries compete in global markets and are well positioned to fully capture favorable market cycles

~85% of output are light & middle distillates

1. Wood Mackenzie index
 2. Saras calculation based on WoodMackenzie methodology, to account for the acquisition of Versalis petrochemical plant
 3. Product Yields are calculated net of "C&L"

Market volatility and variations of discounts / premiums for crudes

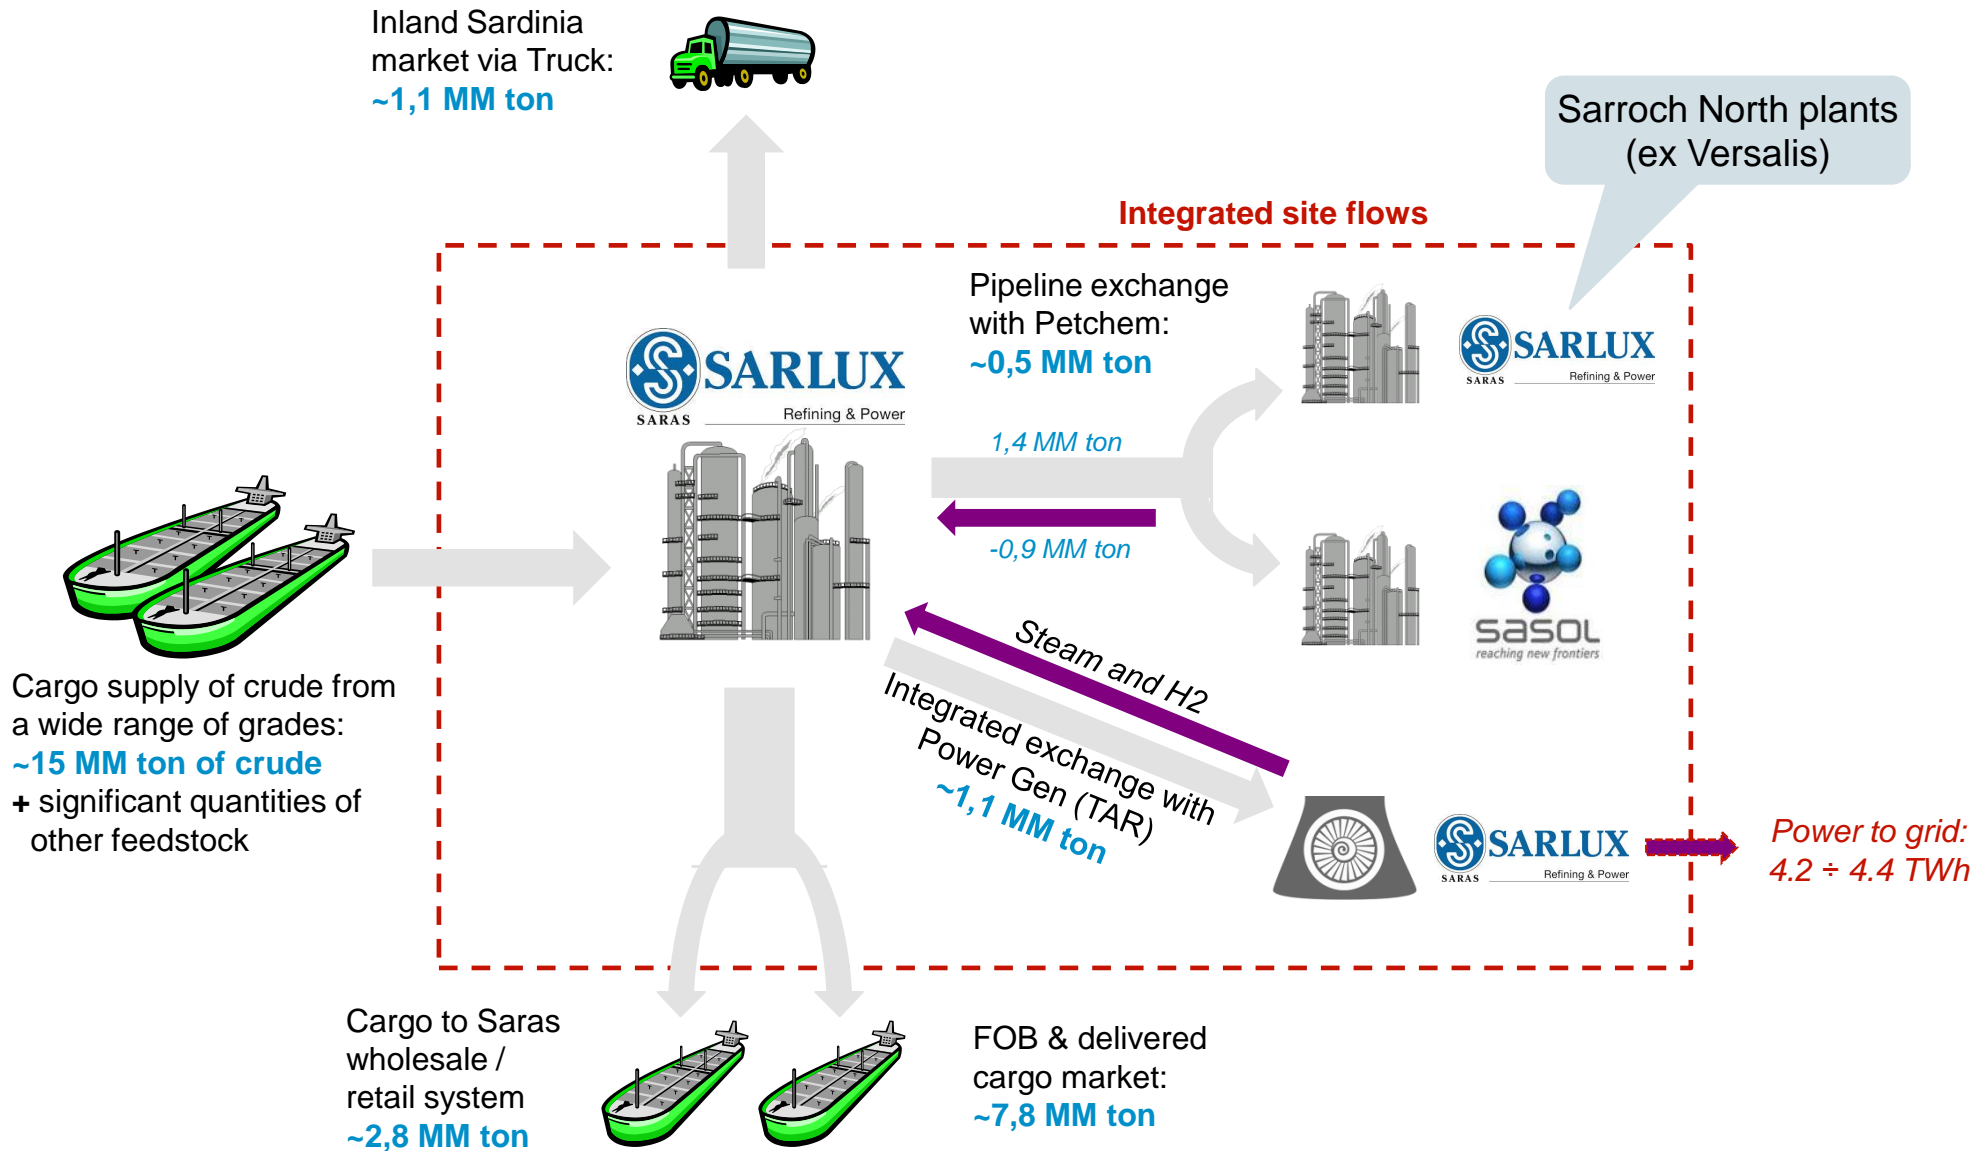

Change in variety of crudes processed and origin of crudes purchased

- **Saras flexible refinery is capable of processing multiple grades of crude**
 - Overcome supply disruptions
 - Exploit opportunities in differentials
- **Its central location allows for a geographically diversified supply**
 - Flexibility in crude origin
 - Supply optimization

... which allow Saras to overcome supply disruptions and exploit market opportunities

Fully-integrated industrial site, with Power Generation & Petrochemical

- IGCC economics are stable and based on attractive regulated contract (CIP6/92)
- The CIP6/92 contract with National Grid operator (GSE) enjoys priority of dispatching and full CO₂ cost reimbursement until April 2021
- **In the scenario post 2021, Saras' IGCC plant is ideally positioned to fully capture the opportunities arising from high sulfur, heavy crude productions**

**Power Generation
Comparable EBITDA (EUR MM)**

HSE

- Injury index down from 7 to 2
- SOx emissions down 20%
- BBS (Behaviour Based Safety) Project

Asset Upgrade

- MHC2 Revamping
- Upgrade of IGCC turbines

Versalis Deal

- Sarroch site strengthening plan
- Versalis assets/resources integration

Integration with petrochemical plants (ex Versalis)

- **Benefits from petrochemical:**
 - ✓ Maximisation of naphtha runs in reforming unit, to exploit strong gasoline premium
 - ✓ ~15% increase of propylene splitter throughput to maximize yield of Polymer Grade Propylene
 - ✓ Optimisations of production cycles and energy integration
 - ✓ Cost optimisations (procurement, material management, 3rd party services, etc.)
 - ✓ Further potential from the possible direct sales of upgraded of petchem feedstock

Continuous strengthening of capabilities

- **Internal capability building program**
- **External talent sourcing for Senior / Middle Management**
- **World-class consulting**

Supply Chain Integration and Trading Company in Geneva

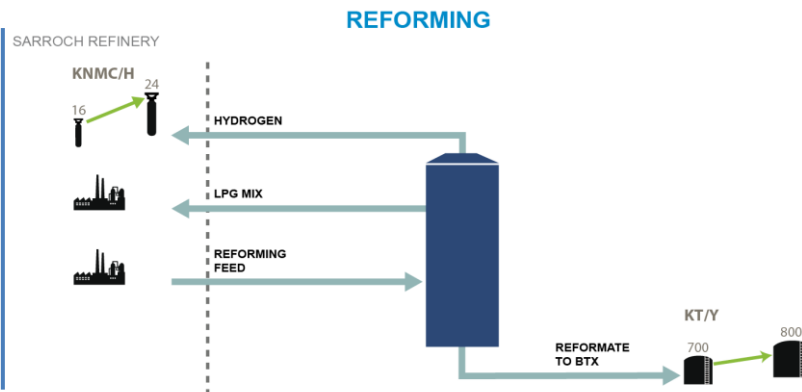

- **Higher integration and economic driven optimization of supply chain and refinery processes**
 - ✓ To boost optimization decision making and rationalisation of assets / models
- **New trading company launched in Geneva, a key European hub**
 - ✓ Proximity to the key players in oil trading / deals opportunities generators
 - ✓ Better access to specialized workforce and timely information

PROPYLENE SPLITTER

In petroleum refining, **Propylene** is a product of the fluid catalytic cracking (FCC). It can be sold directly (as “refinery-grade”) or upgraded to “polymer-grade” specifications. In particular, in the “refinery-grade” specs, the Propylene content is usually 70-75%, while “polymer-grade” specs require a Propylene purity higher than 99.5%

REFORMING

Benzene, Toluene, and Xylene (BTX)

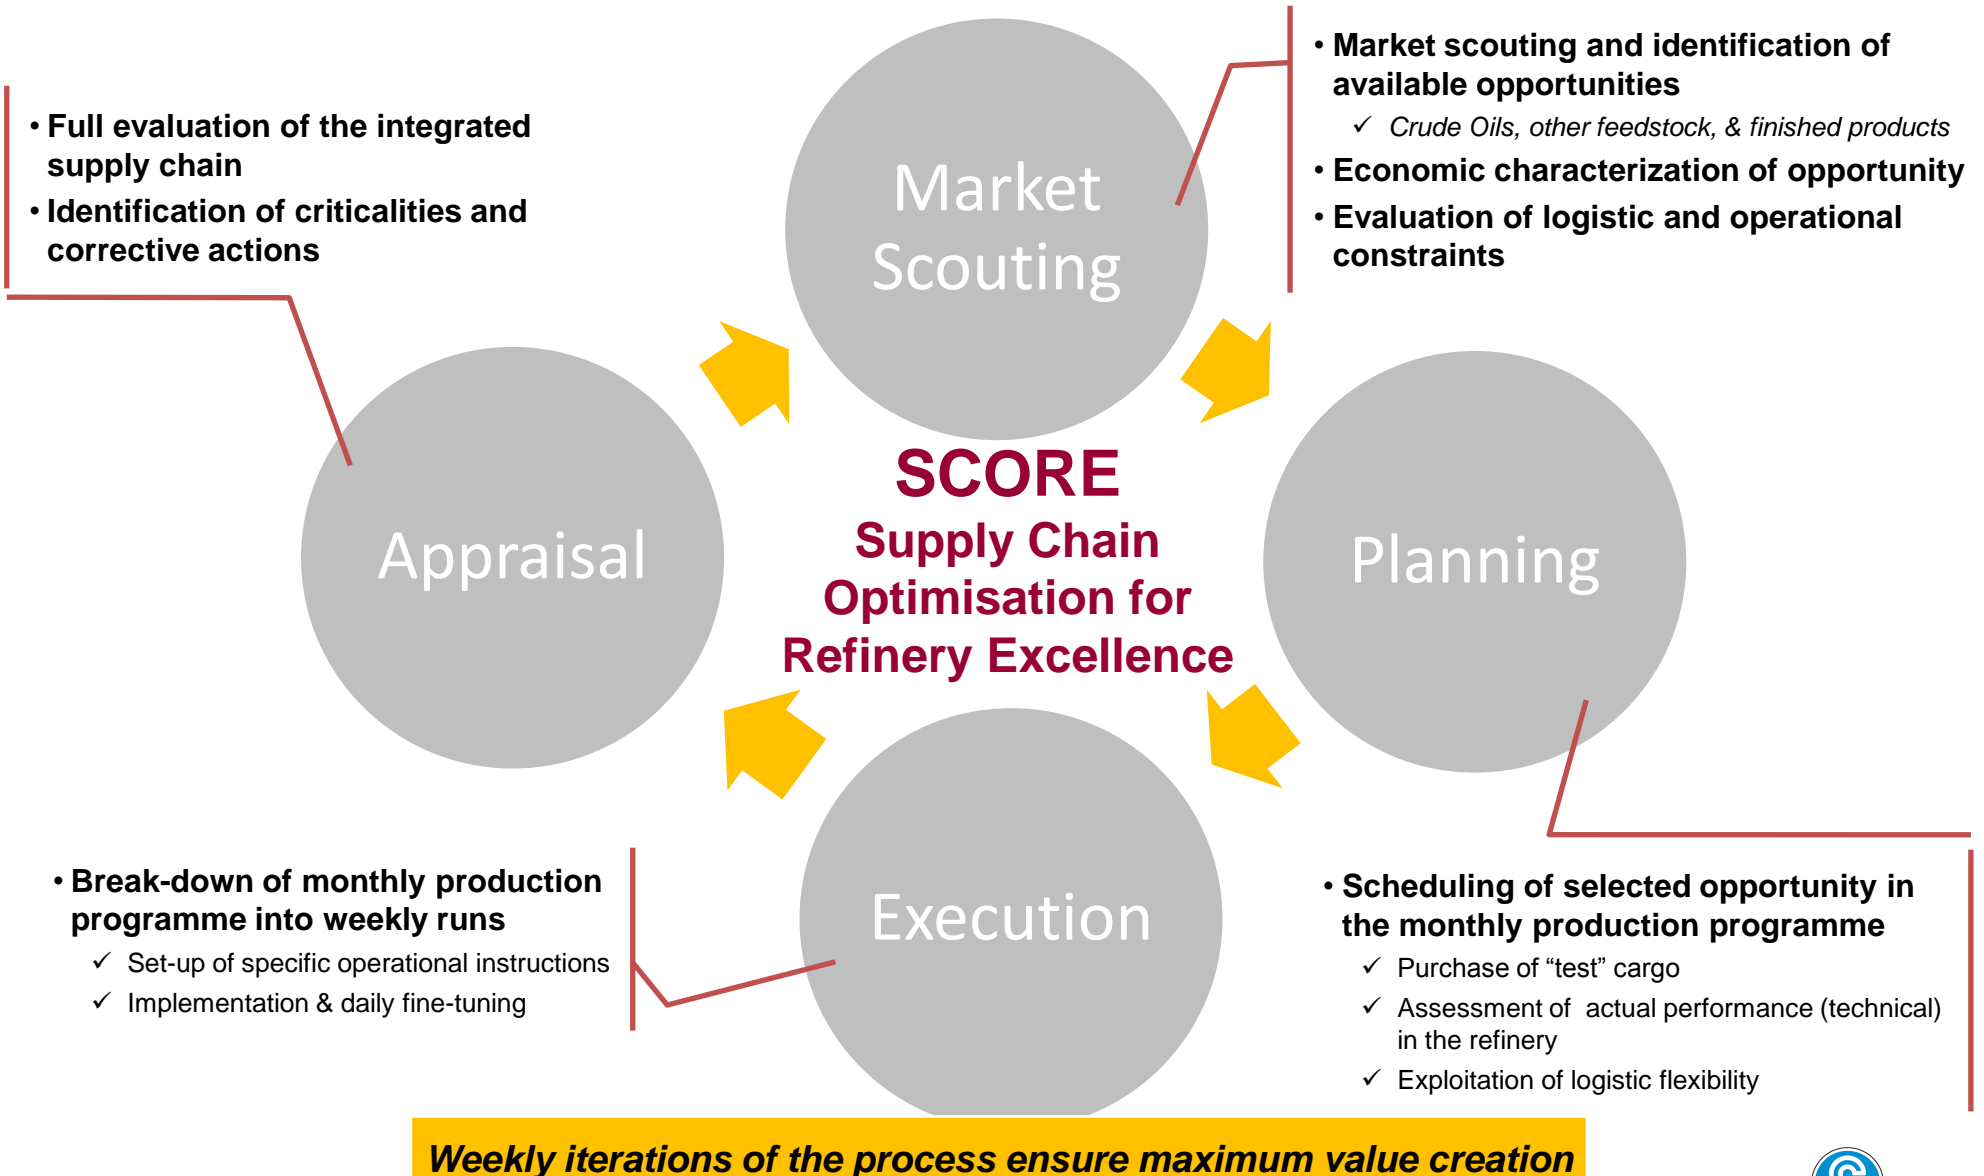

production is based on the recovery of aromatics derived from the catalytic reforming of naphtha. More specifically, the catalytic **reforming** process utilizes as feedstock naphtha that contains non-aromatic hydrocarbons with 6 to 9+ carbon atoms, and typically produces a “Reformat” gasoline containing C6 to C8 aromatics (Benzene, Toluene, mix-Xylene) as well as heavier aromatics containing 9 or more carbon atoms

BTX & FORMEX

The skills and the commitment of the resources are key factors in establishing competitive performance levels

| Refinery other feedstock | Mtons | Approx. 1.0 ÷ 1.5 | | | |
| IGCC Power production | TWh | Approx. 4.2 ÷ 4.5 | | | |
| Total Fixed costs (Refining + Power) | € M | Approx. 360 ÷ 370 | | | |

Outlook for crude oil markets

Global oil supply expected to remain robust over the plan period

- OPEC cuts will likely be offset by ramping-up E&P activities in US (light sweet) and in North-Eastern Caspian Sea (light sweet crude and condensates from Kashagan), as well as production increases in Libya and Nigeria

Outlook for “light sweet – heavy sour” price differential

- Shrinking in 2017 due to OPEC production cuts (mainly heavy-sour), and increase of light sweet supply
- Material widening in 2019-20, driven by “IMO – Marpol VI” regulations:
 - ✓ From Jan. 2020 bunker fuel maximum allowed Sulphur percentage down from 3.5% to 0.5%
 - ✓ Heavy and medium sour crude oils expected to increase their discounts vs. Brent
 - ✓ Increase in premium of light sweet crude oils (more suitable to produce bunker fuel at 0.5% Sulphur)

Global refining key takeaways

- **PRODUCT DEMAND**
 - » Growth in global demand to slow from 2018
 - » 2020 will see a boost in distillate demand from IMO's switch in marine fuel
- **PRODUCT SUPPLY**
 - » Investments in conversion & coking capacity are outpacing new crude unit capacity
 - » Gasoline investments continue to improve product quality
 - » Distillate investment continue to increase global supply
 - » More complex refinery capacity means lower runs required to meet global demand
- **REFINING OUTLOOK**
 - » Costal, deep conversion units will see a boost to refinery margin with IMO legislation
 - » Refinery margins will see a positive step change in 2020 as they increase runs & fill upgrading capacity to meet additional distillate demand for IMO compliance

Source: Wood Mackenzie

9 Trusted commercial intelligence
www.woodmac.com

Wood Mackenzie
A Verisk Analytics Business

According to Wood Mackenzie, a leading independent market consultancy, IMO regulation will trigger:

- Large increase in marine gasoil demand in 2020 (sustained through 2025)
- Relevant investment in conversion and coking capacity for lower complexity refineries (to find ways to dispose of Fuel Oil production)

Refining outlook is positive:

- Margins will see a positive step change in 2020
- Costal, deep conversion units most favoured

The MARPOL VI legislation will provide support for Europe's deep conversion units

Source: Wood Mackenzie – Refinery Evaluation Model

Saras is ideally placed to play this scenario:

- Widening of “heavy-sour / light-sweet” differential will increase Saras premium to EMC Benchmark margin
- **Transformational investments are not necessary:** Saras IGCC plant already efficiently converts heavy part of the barrel into precious electricity, as well as steam and hydrogen which are sent back to the refinery

Visbreaking revamping

150 -200 M€ CAPEX

- **Final decision on investment** aimed at consolidating the site's operational configuration & Group's profitability after the CIP/6 expiry **to be taken in 2018**
- Recent developments of "IMO – Marpol VI" regulations outline a long-term scenario with progressively widening discounts for heavy sour crude oils
- Under this scenario the **revamping of the Visbreaking Unit would:**
 - **Enable production of cheaper feedstock (i.e. heavier TAR)**
 - **Increase the % of heavy sour crude oils in the refinery feed**
- Expected benefits from **revamping of the Visbreaking Unit:**
 - **1 IGCC power train dedicated to self-consumption**, leading to savings for system and dispatching charges for the refinery
 - **Higher runs of heavy sour crude oils in the refinery**, leading to cheaper cost of refinery feedstock

~1.0TWh self consumed
+ ~3.6 TWh sold

Saras Improvement Initiatives and CAPEX Plan

Business Plan Group “committed” CAPEX¹

1. Further “non-committed” CAPEX refer to a portfolio of additional refinery upgrades, to be evaluated on a yearly basis

Expected EBITDA from Improvement Initiatives

Saras SpA

Main development CAPEX included in Plan

- **Logistics upgrades:** jetty upgrade for berthing of larger vessels, and extensions of crude oil lines
- **Northern plants:** BTX revamping, Splitter improvements, and power station upgrade
- **Southern plants:** FCC oxygen enrichment, Chiller for LPG recovery on fuel gas network, other minor works
- **Energy efficiency:** New FCC blower and power recovery unit (Expander); internal power grid reconfiguration; new steam and fuel gas interconnection between Northern & Southern plants

Operational Improvements included in Plan

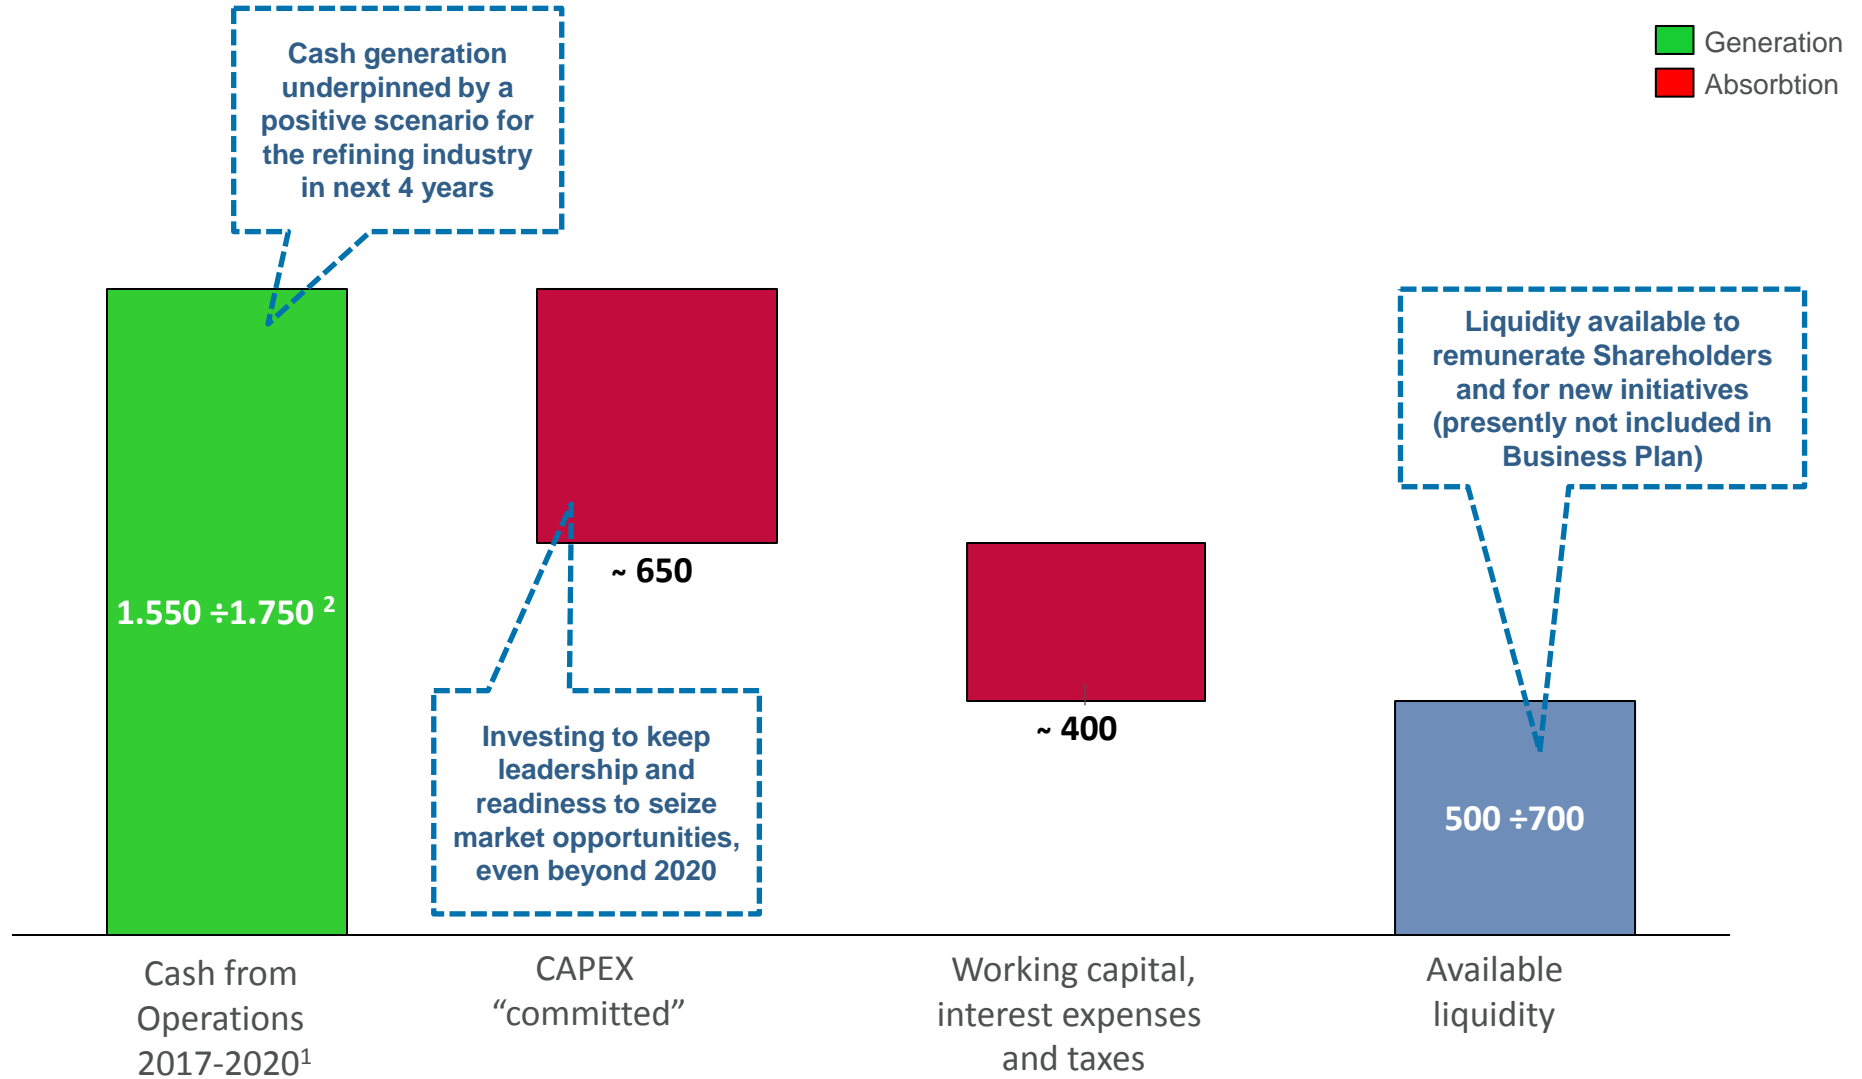

- Steam management across the site
- Increased focus on heat exchangers’ efficiency
- Improved energy performance tracking / control

Segments profitability outlook

| Segment | Comments |
|------------------|--|
| Refining | <ul style="list-style-type: none">• EMC Benchmark margin at 2 ÷ 2.5 \$/bl (based on reference scenario)• Saras' premium to EMC Benchmark from approx. 3.5 \$/bl in 2017 to approx. 4 \$/bl in 2020 (including improvement initiatives and additional benefits deriving from Integrated Supply Chain Management) |
| Power Generation | <ul style="list-style-type: none">• EBITDA of approx. EUR 200M/year• Electricity produced to be sold according to CIP6/92 tariff |
| Marketing | <ul style="list-style-type: none">• EBITDA of approx. EUR 10M/year• Profitability recovery coming from cost rationalization and implementation of initiatives for optimization of sale channels & working capital |
| Wind | <ul style="list-style-type: none">• EBITDA between EUR 20 ÷ 25M in 2017• EBITDA between EUR 5 ÷ 10M in the period 2018-20, due to the expiry of incentives on ~80% of the installed capacity |

Sources and uses of cash (Cumulated 2017-2020)

M€

1. Cash Flow from operations = EBITDA – Linearization effect on Power Generation – others
2. Variability for Cash Flow generation derives mainly from range assumed for EMC Benchmark margin

Cost Optimisation Programme prudentially not included in the Plan

Cost Optimisation Programme

- Cost optimisation programme started in early 2017
- Effects – **prudentially not included in the Plan** – should compensate a sizeable portion of growing costs associated with environmental regulations and inflationary cost drifts
- Expected savings to be incorporated in subsequent updates of the business plan
- The main areas which will be targeted are the following:

Approach and main levers

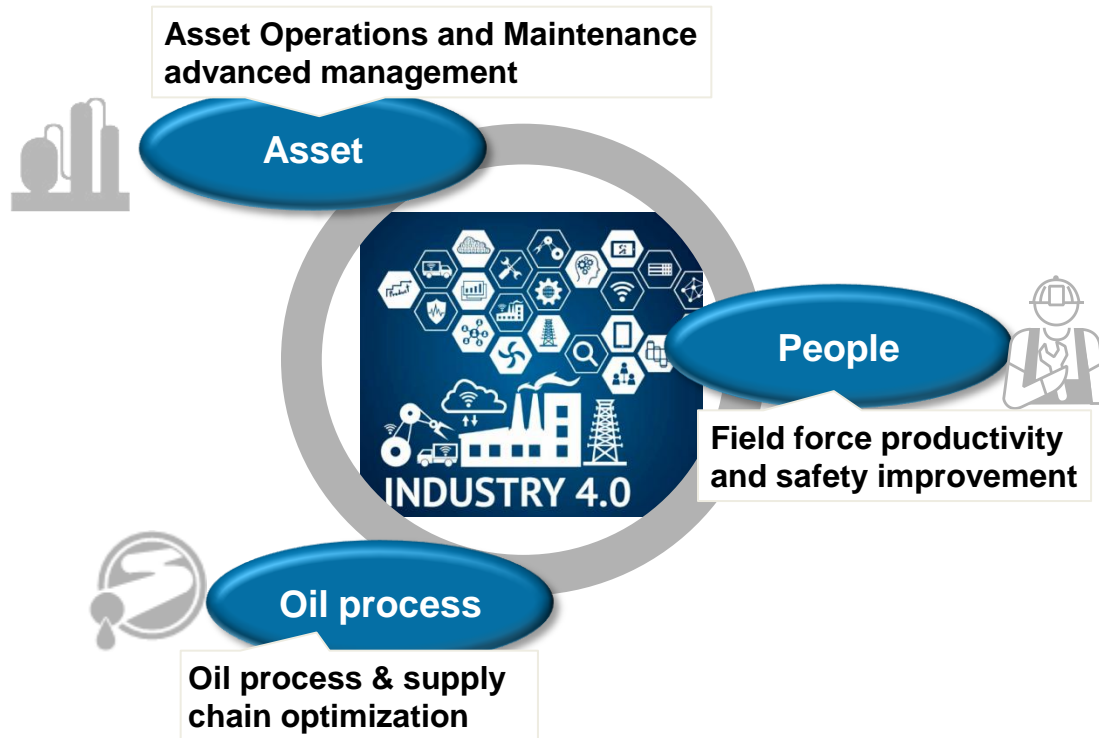

- **Bottom up approach:** project managed and driven by the process owners
- **Focus on reduction of inefficiencies** at all levels
- **Levers to be exploited:** volumes, processes, technological innovation
- **Process reengineering**

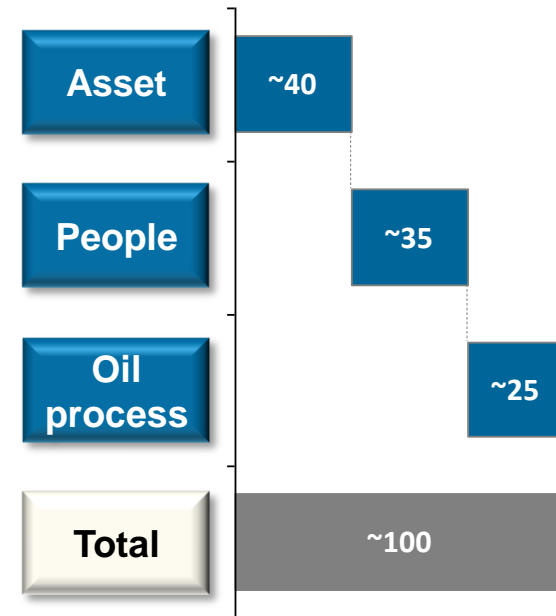

A 3-steps digital transformation journey from vision to industrialization

Saras IGCC plant is fundamental to convert “bottom of the barrel”

Sarlux site configuration

- Three independent trains for gasification and power production, with a total design capacity of 575 MW

IGCC role

IGCC processes High Sulphur (HS) crudes "bottom-of-barrel" and has 3 main outputs:

- Power
- Hydrogen
- Steam...

...making the IGCC very important even after expiry of the CIP6 scheme

- Instrumental to economically process HS crudes and to fully exploit the site assets
- Hydrogen and steam production are necessary for refinery operations
- ~1TWh of power production will be self-consumed to further reduce exposure to power market

The IGCC operational flexibility will be exploited with an integrated perspective

Note: Arrow width proportional to material flow size, plant surfaces proportional to Nelson Complexity Index. Semifinished products not shown

Overview of the Italian and Spanish Marketing businesses

Spain: Saras Energia

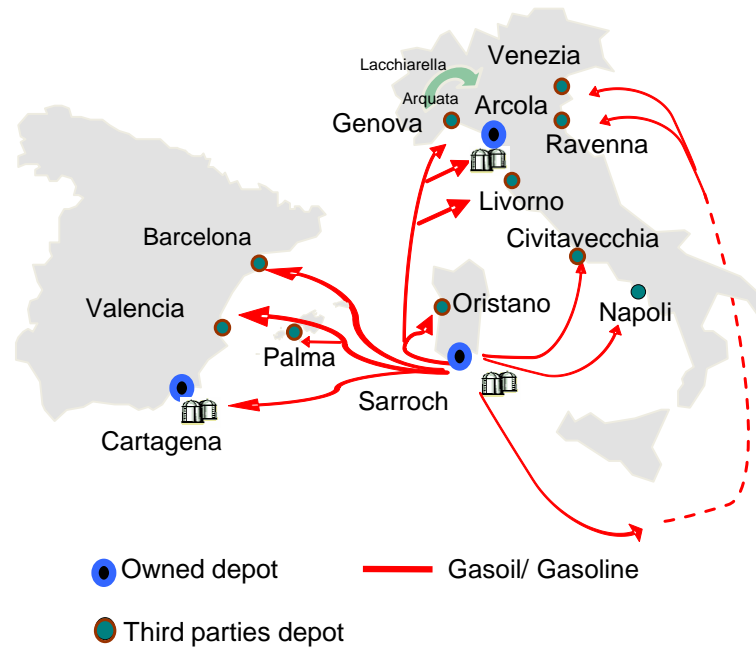

Spain wholesale

- 114kmc distillates storage in Cartagena 
- ~10% share of wholesale market

Spain retail

- 101 service stations 
 - 86 fully owned
 - 15 long term leased
- ~155kmc sold in 2016
- Mainly located in the Med tributary, with CLH Depots regional support

Main logistics flows

Italy: Saras SpA

Arcola La Spezia (owned)

- 200kmc storage for diesel and gasoline 
- ~8% share of wholesale market
- Sea Terminal for up to 50kt DWT 
- Logistics available for bunkering

Transfer depots network (3rd party)

- Logistics efficiently covers all richest northern and central regions (Genova, La Spezia, Livorno, Civitavecchia, Venezia, Napoli and Ravenna)
- Strong position in Livorno, Venice and Civitavecchia

Reaching further downstream

- i.e. resellers, unbranded service stations, supermarket chains, etc...

1. Feed-in Premium Tariff since 1st Jan 2016 – previously Green Certificates

ULASSAI WIND FARM

Sardeolica

- 96 MW (48 Vestas aero-generators), with production ranging from 170 up to 200 GWh per year
- Operations started at the end of 2005
- Green Certificates granted until 31st Dec 2015, and later feed-in premium tariff until 2018 (same value as Green Certificates)
- Seven more years of feed-in premium tariff (2025) on the last units installed (about 20% of the installed capacity)

LONG-TERM DEBT MATURITY PROFILE (as of 31st Dec 2016)

SARAS Group: Long Term Debt Outstanding

SARAS Group: Long Term Debt Maturity Profile

NOTE: all debt is unsecured

In 2016, various refinancing operations were successfully completed, including restructuring of all outstanding loans and early repayment of a Bond issued in 2014. As a result, interest cost are expected to be reduced by approx. 40%.

Group Credit lines

Risk of changes in prices and cash flows

To mitigate the risks arising from oil prices variations (which impact on the refining margins and on the oil stock value), the company enters into derivative contracts in commodities, which involve the forward buying and selling of crude oil and products.

Exchange rate risk

To reduce both its exchange rate risk in future transactions and the risk inherent in assets and liabilities denominated in a different currency to the functional currency of each entity, the company sets up derivative instruments which consist of the forward buying and selling of foreign currencies (US dollars). Transactions expressed in currencies other than US dollars are not significant and could only have a very low impact on the results for the year.

Interest rate risk

The risks relating to changes in cash flows caused by changes in interest rates arise from loans. The loan agreements outstanding have been entered into at variable market rates. The company's policy is to use derivative instruments to reduce the risk of changes in interest cash flows.

Credit risk

The market in which the company operates mainly consists of multinational companies operating in the oil industry. Transactions entered into are generally settled in very quickly and are often guaranteed by prime leading banks. Furthermore, loans are systematically and promptly monitored on a daily basis by the Finance department. This risk is minimal and does not constitute a significant variable in the business in which the company operates.

Risks of interruption of production

The complexity and modularity of its systems limit the negative effects of unscheduled shutdowns. The safety plans in place (which are continuously improved) reduce any risks of accident to a minimum: in addition Saras has a major programme of insurance cover in place to offset such risks.
